Abstract of DE3929064

A container (10) holds a liq. which can be discharged in measured quantities through an atomising nozzle attached to the container. The nozzle is actuated by depressing the cap (11) which is connected to a hollow piston (14) inside the atomiser head. The hollow piston (14) slides inside a first sleeve (15) and presses a second sleeve (16) downwards against a spring (17). The first sleeve (15) has its lower end connected to the standpipe (22) which extends to the bottom of the container. The second sleeve (16) has internal walls which form a siphon with jet flow through the siphon being controlled by two valves formed by two balls. USE - Spraying of an atomised liq. @8pp Dwg.No. 1
